

Armafix[®]

Armafix pipe supports are recommended for use where thermal bridging may occur. This is particularly important on refrigeration and chilled water pipes where there is a possibility of condensation taking place, between the pipe and its fixing. In heating installations the use of pipe supports will generally improve energy conservation.

Insulating the entire pipework system - inclusive pipe hangers - ensures effective de-coupling from supporting and structural elements as well as other service installations. This prevents acoustic bridging, often responsible for the majority of pipework noise within the building.

- One piece with self-adhesive closure to prevent condensation
- Built-in vapour barrier eliminates thermal bridging
- Fibre free insulation with thermal and acoustic properties
- Absorption of static forces in vicinity of brackets
- Excellent de-coupling and isolation performance Installed in three easy steps
